with Visibility and Control*

IVAN – Enabling Efficient, Compliant and Reliable Processing of Internal DoD and Federal Intragovernmental Transactions

Increases Visibility of Intragovernmental Transactions

THE BUSINESS TRANSFORMATION AGENCY'S INTRAGOVERNMENTAL VALUE ADDED NETWORK (IVAN) System is a fully web-based application that allows requesting agencies to create or post intragovernmental transactions for viewing and acceptance by servicing agencies. Requesting and servicing agencies can view both the content and status of an order throughout the entire lifecycle of the order – from the initial creation of the order, buyer approval, funds commitment, seller acceptance, funds obligation, and amendments. IVAN provides a central repository where both requesting and servicing agencies have accurate, online, real-time access to the order information and supporting documents.

Supports Financial Eliminations

The ability to support intragovernmental financial eliminations has been identified as a material weakness within the Department of Defense. IVAN has the capability to interface with financial management systems on both the requesting and servicing agency sides to gather financial data to support financial eliminations. IVAN contains the information required to match the requesting agency's transactions with the servicing agency's transactions. The Trading Partner Report ties that information together and highlights orders and funding lines that are potentially mismatched between the requesting and servicing agencies.

IVAN identifies eliminations problems at a summary level and then allows users to dive down into the individual general ledger transactions.

Reduces Potential for Anti-Deficiency Act (ADA) Violations

IVAN has been specifically designed with the support and recommendations of the Office of Defense Procurement, Acquisition Policy, and Strategic Sourcing (DPAP), and the Office of the OSD Comptroller to reduce the potential for ADA violations. IVAN has specific capabilities for capturing the bona fide need, ensuring the funding is both current and correct, and providing a comprehensive, configurable, mandatory approval checklist. IVAN contains a robust and highly configurable workflow module which allows both the requesting and servicing agencies to model complex existing business rules for the approval and distribution of intragovernmental orders.

Supports Strategic Spending Analysis

As a centralized repository for intragovernmental transactions created both within and outside of the system, IVAN is in a unique position for supporting strategic spending analysis. All transactions are identified at the order and item level by NAICS, product code, and description. Built-in ad hoc querying capabilities allow users to create reports identifying what is being purchased, when, and by whom.

IVAN

A PRISM-IGT Solution

Key Features

- Ordering system capability
- Ability to post orders created outside of the system
- Paperless transactions
- Form generation
- Site configurable automated routing/ approval process
- Line of accounting validation
- Funds expiration checks and notifications
- SFIS capable
- Support for acquisition fees
- Support for bona fide need statement
- Support for acquisition authority
- Site level configurable approval checklists
- Attachments/notes
- Email/notifications
- Built-in messaging system
- Pre-execution view capabilities
- Error checking
- Common set of data
- Automatic updates to the accounting system to post commitments and obligations
- Financial system interface capability to support eliminations
- Ad hoc query capability
- Web-based application
- COTS-based system – based on PRISM software
- CAC-enabled
- DIACAP-certified
